

# Focus on Nature-based Solutions Toward Sustainability

**Environmental Research Letters**  
**Deadline: March 31<sup>st</sup>, 2024**

## Guest Editors

*Xu Yue, Nanjing University of Information Science and Technology, China*

*Ge Sun, USDA Forest Service, USA*

*Mariska te Beest, Utrecht University, Netherlands*

*Jun Zhang, Netherlands Organization for Applied Scientific Research, Netherlands*

*Maricar Aguilos, North Carolina State University, USA*

*Xianglan Li, Beijing Normal University, China*

*Jintai Lin, Peking University, China*

- Responses of diverse ecosystems to the climate, environment, and societal changes.
- The role of NbS in enhancing land carbon sink strength and improving water quality and quantity, and other ecosystem services.
- State of art in integrating cross-site and long-term measurements and modeling of ecosystem fluxes.
- Advances in big data fusion, modeling, and integration technology through ESM and machine learnings.
- The economical and societal benefits of NbS in context of ecosystem functions and dynamics.
- Mechanistic understanding of coupling human and nature systems through the lens of climate, environment, and ecosystem interactions.

- 9 articles published
- 5 articles accepted
- 7 revised articles in peer review
- 8 original articles in peer review
- 5 articles rejected (following peer review)
- **11 articles agreed for submission – delayed**

20-25 papers are expected to be published in ERL focus issue

Most papers are contributed by USCCC members and their students

**第20届中美碳联盟年会**  
**20<sup>th</sup> Annual Conference for USCCC**

**南京信息工程大学**  
Nanjing University of Information Science & Technology

**Large potential of strengthening the land carbon sink  
in China through anthropogenic interventions**

**Xu Yue (乐旭)**

**July 17<sup>th</sup>, Xining**

# Ecosystem is the largest land carbon sink

## The global carbon cycle

# Reforestation has the largest potential of increasing C sink

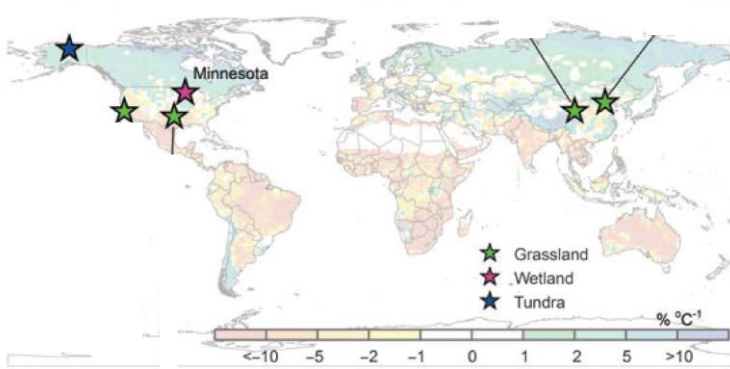

Griscom et al. (2017)

Qin et al. (2021)

# Land carbon uptake is constrained by environment and climate

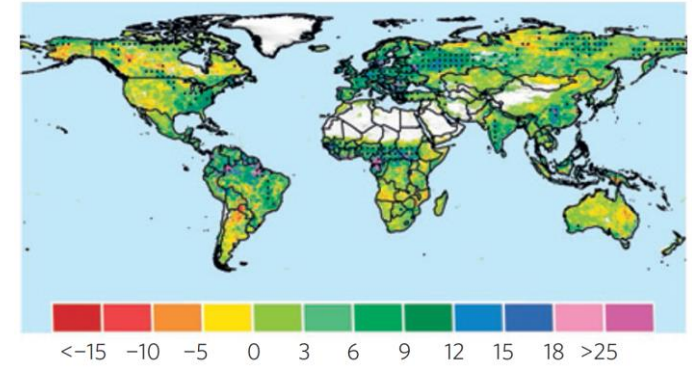

## Nonlinear response to Tair

(Piao et al. *GCB*, 2013)

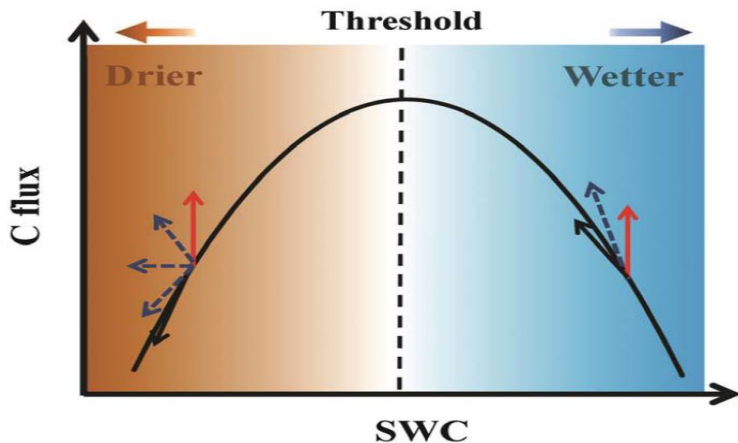

## CO<sub>2</sub> fertilization

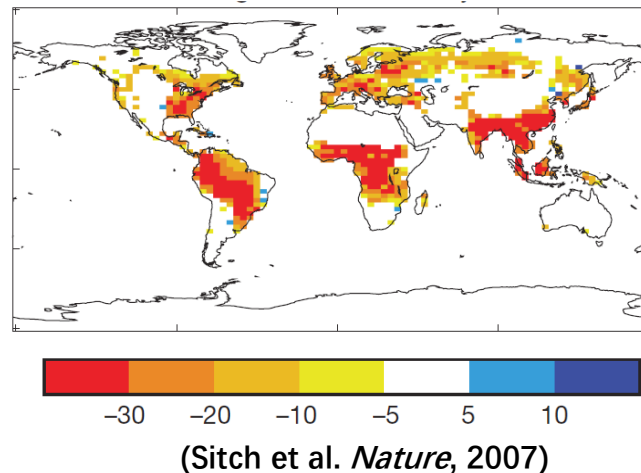

(Zhu et al. *Nat. Clim. Change* 2016)

## Nonlinear response to Wsoil

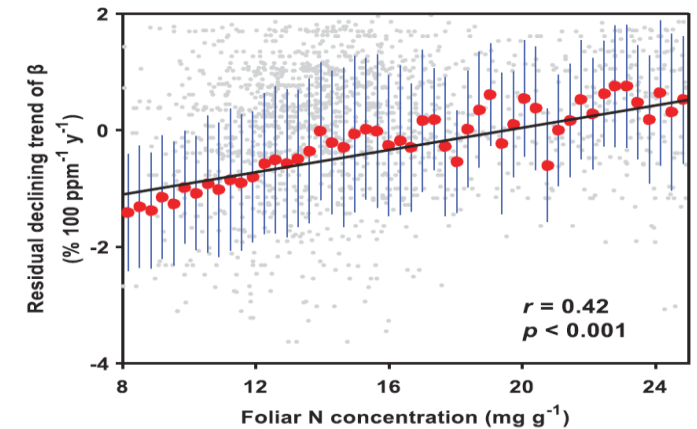

(Quan et al. *Sci. Adv.*, 2019)

## Ozone deposition

(Sitch et al. *Nature*, 2007)

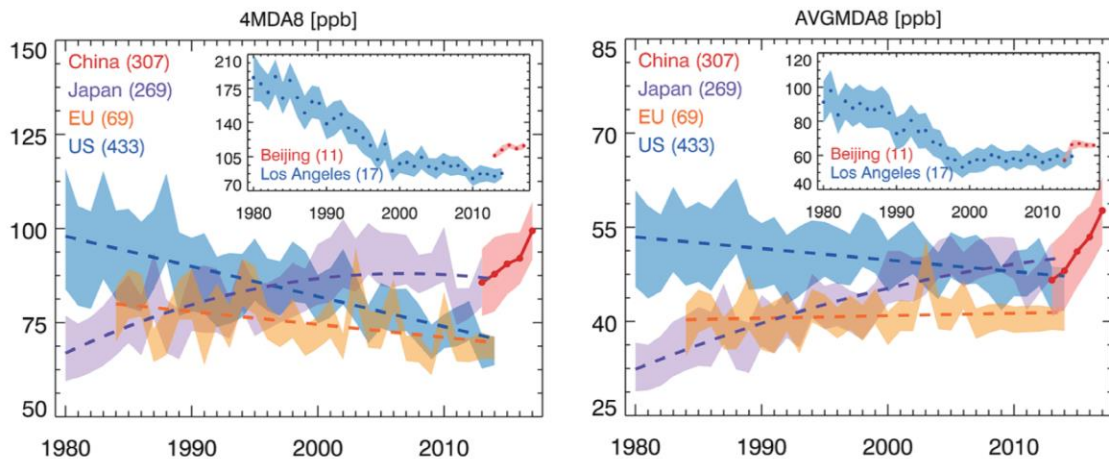

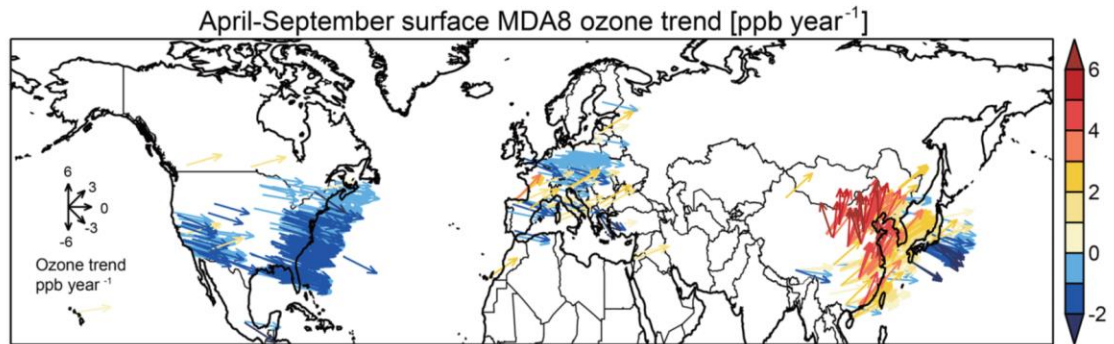

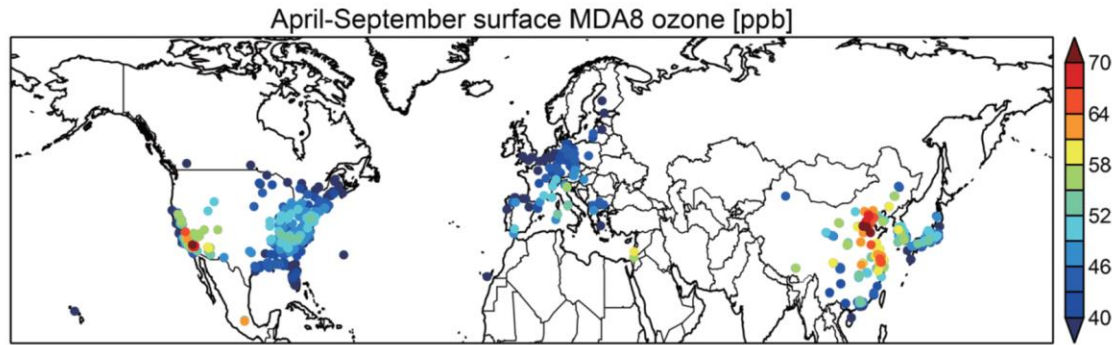

## Nitrogen deposition

(Wang et al. *Science*, 2020)

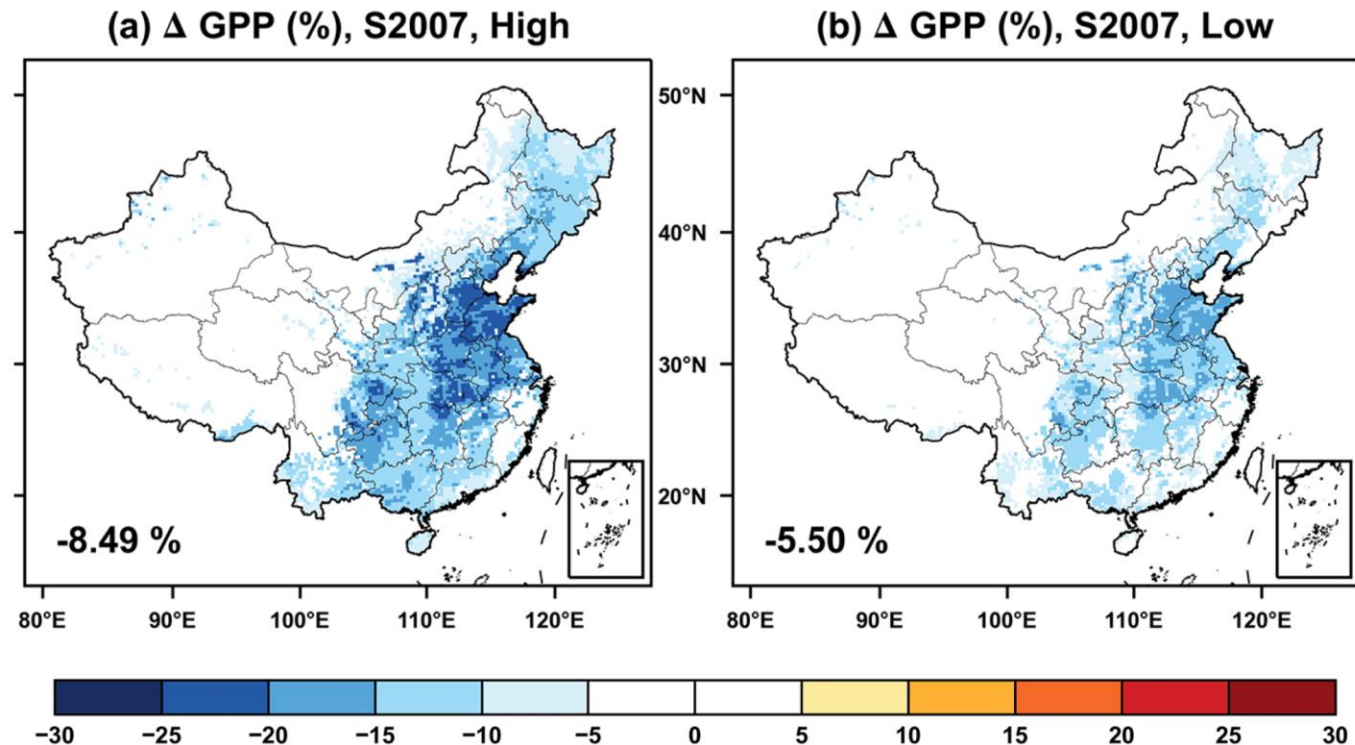

# High ozone dampens carbon sink in China

(Lu et al. 2018, 2020)

□ Ozone pollution is rising in China

□ Ozone damages plant photosynthesis, reducing ecosystem productivity and crop yield

(Cao et al. 2024)

# Litter removal helps promote land carbon sink

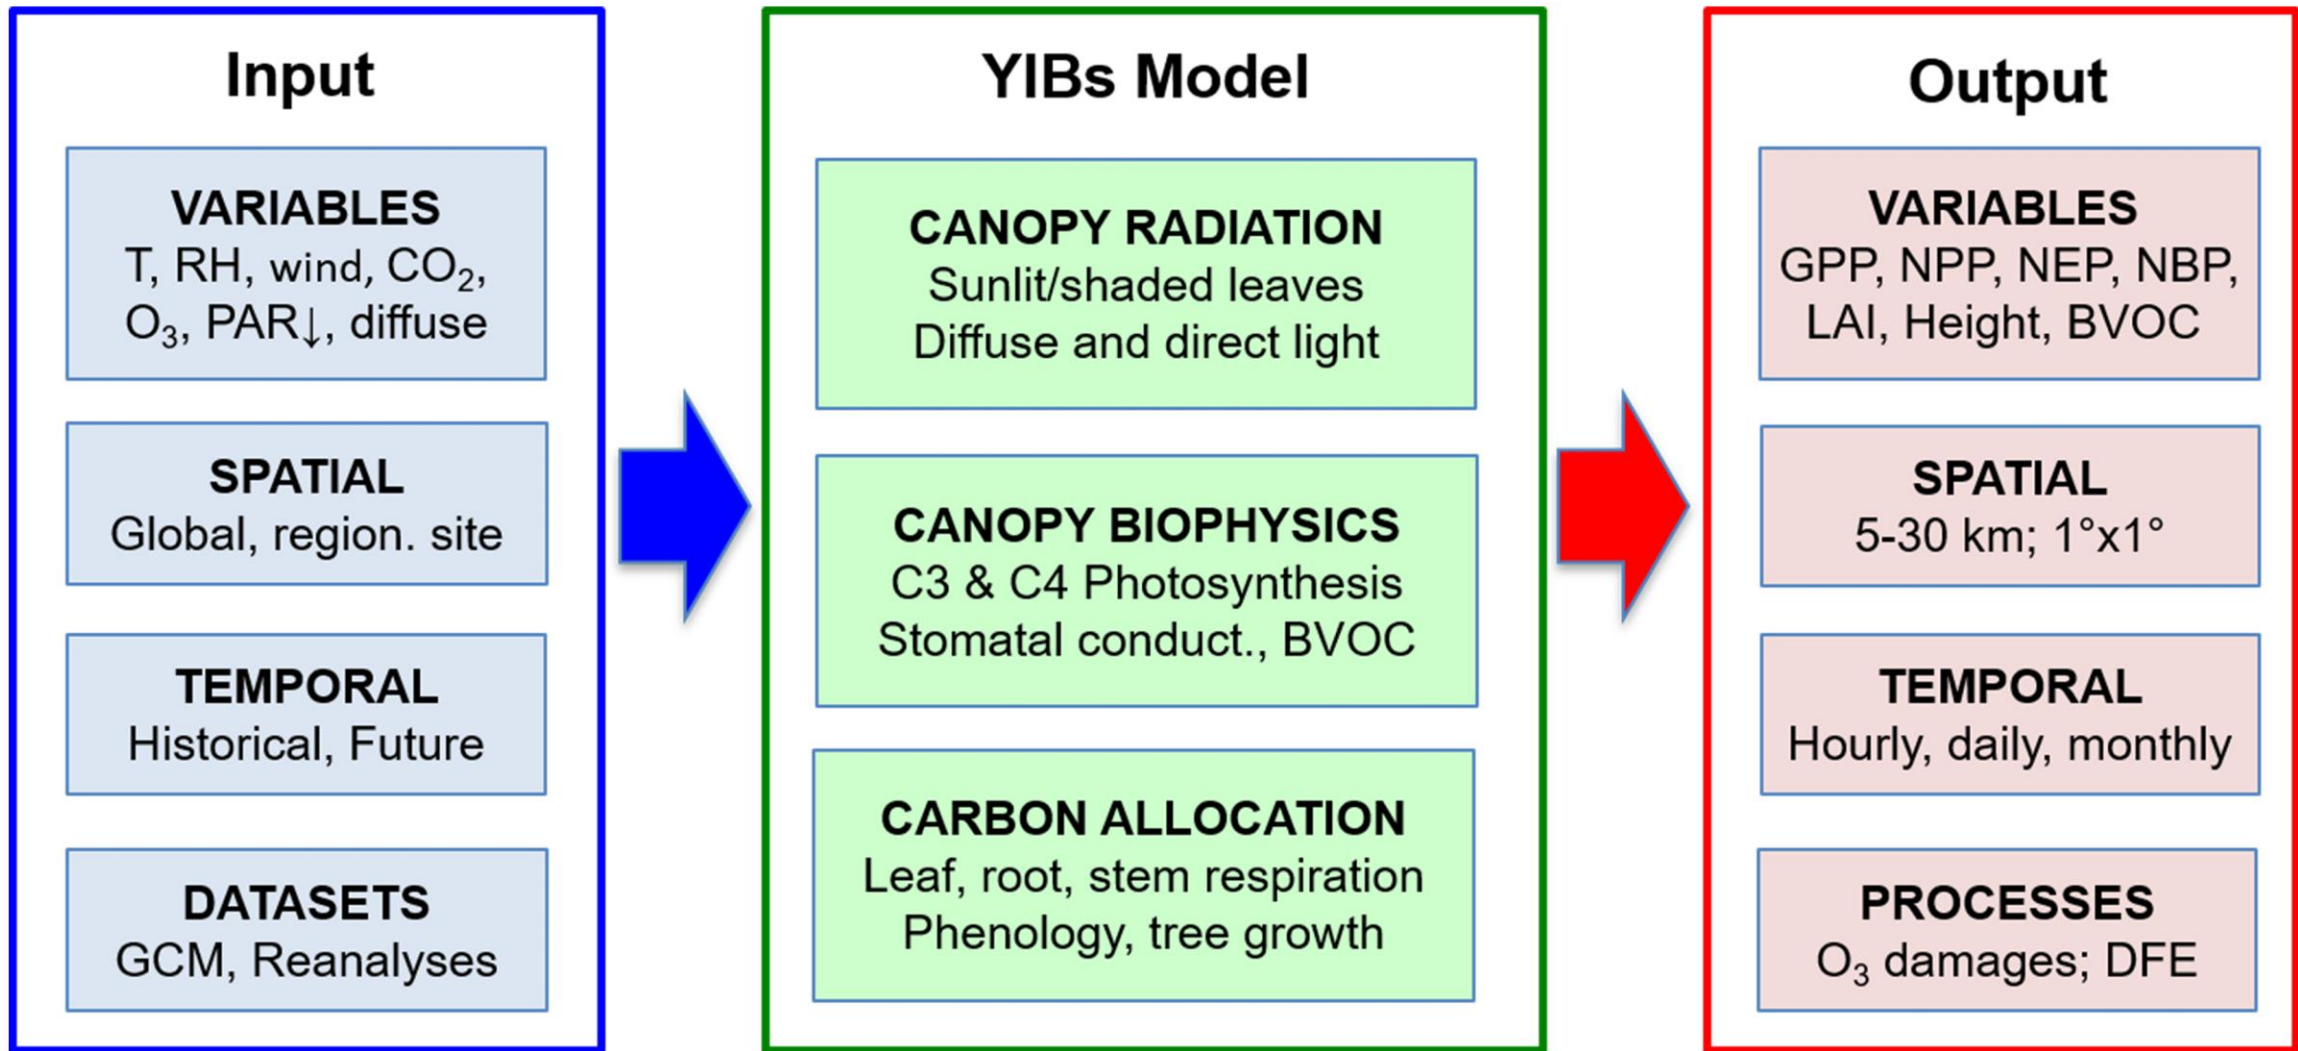

# Questions

- How the **carbon sink** in China responds to the future changes in climate and environment?
- To what extent will **carbon sink** increases with anthropogenic interventions? (Reforestation, O<sub>3</sub> control, litter removal)

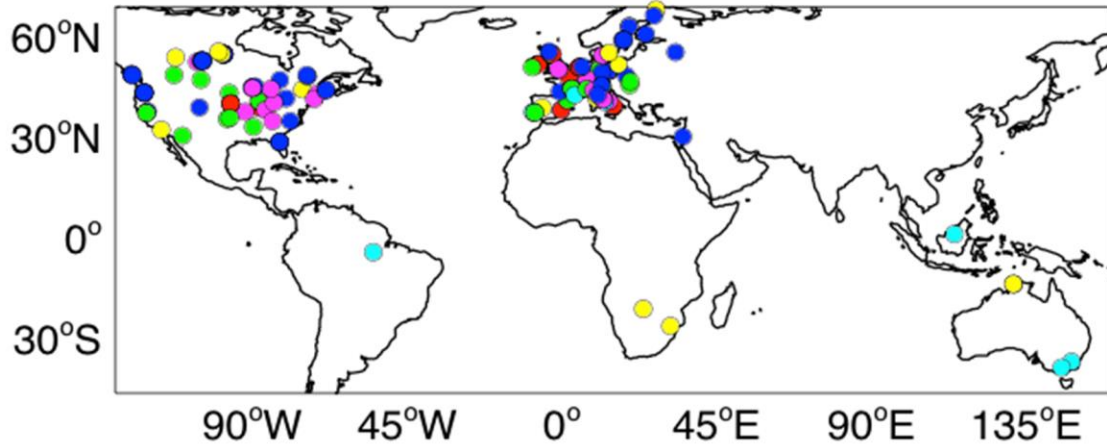

# Yale Interactive terrestrial Biosphere Model (YIBs)

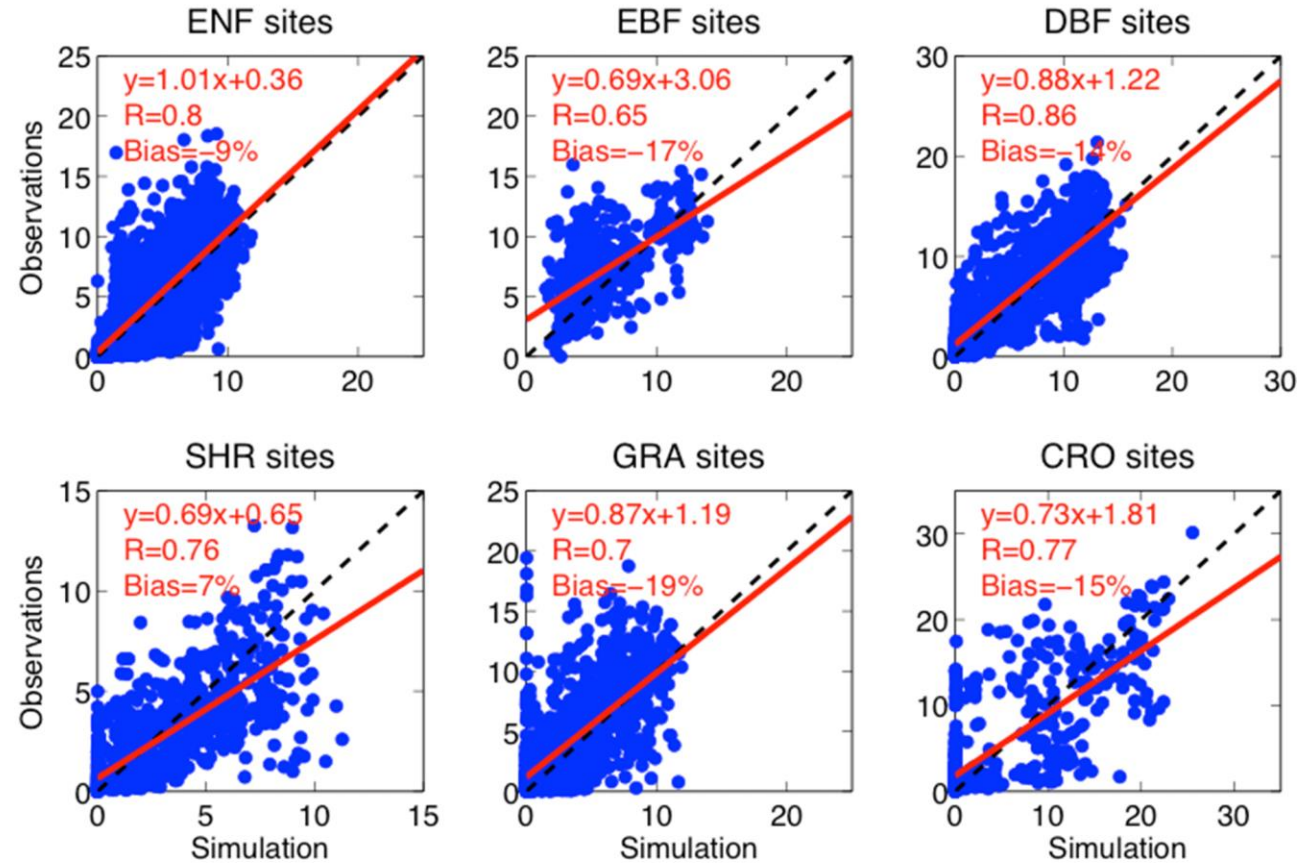

# YIBs model evaluations

145 FLUXNET sites

- Evergreen Needleleaf Forest
- Evergreen Broadleaf Forest
- Deciduous Broadleaf Forest
- Shrubland
- Grassland
- Cropland

□ The model shows good performance at individual sites

# YIBs model evaluations

□ The model shows good performance in global carbon and water fluxes

(Friedlingstein, et al., 2023)

# Ozone vegetation damage in model

Sitch et al. (2007) scheme

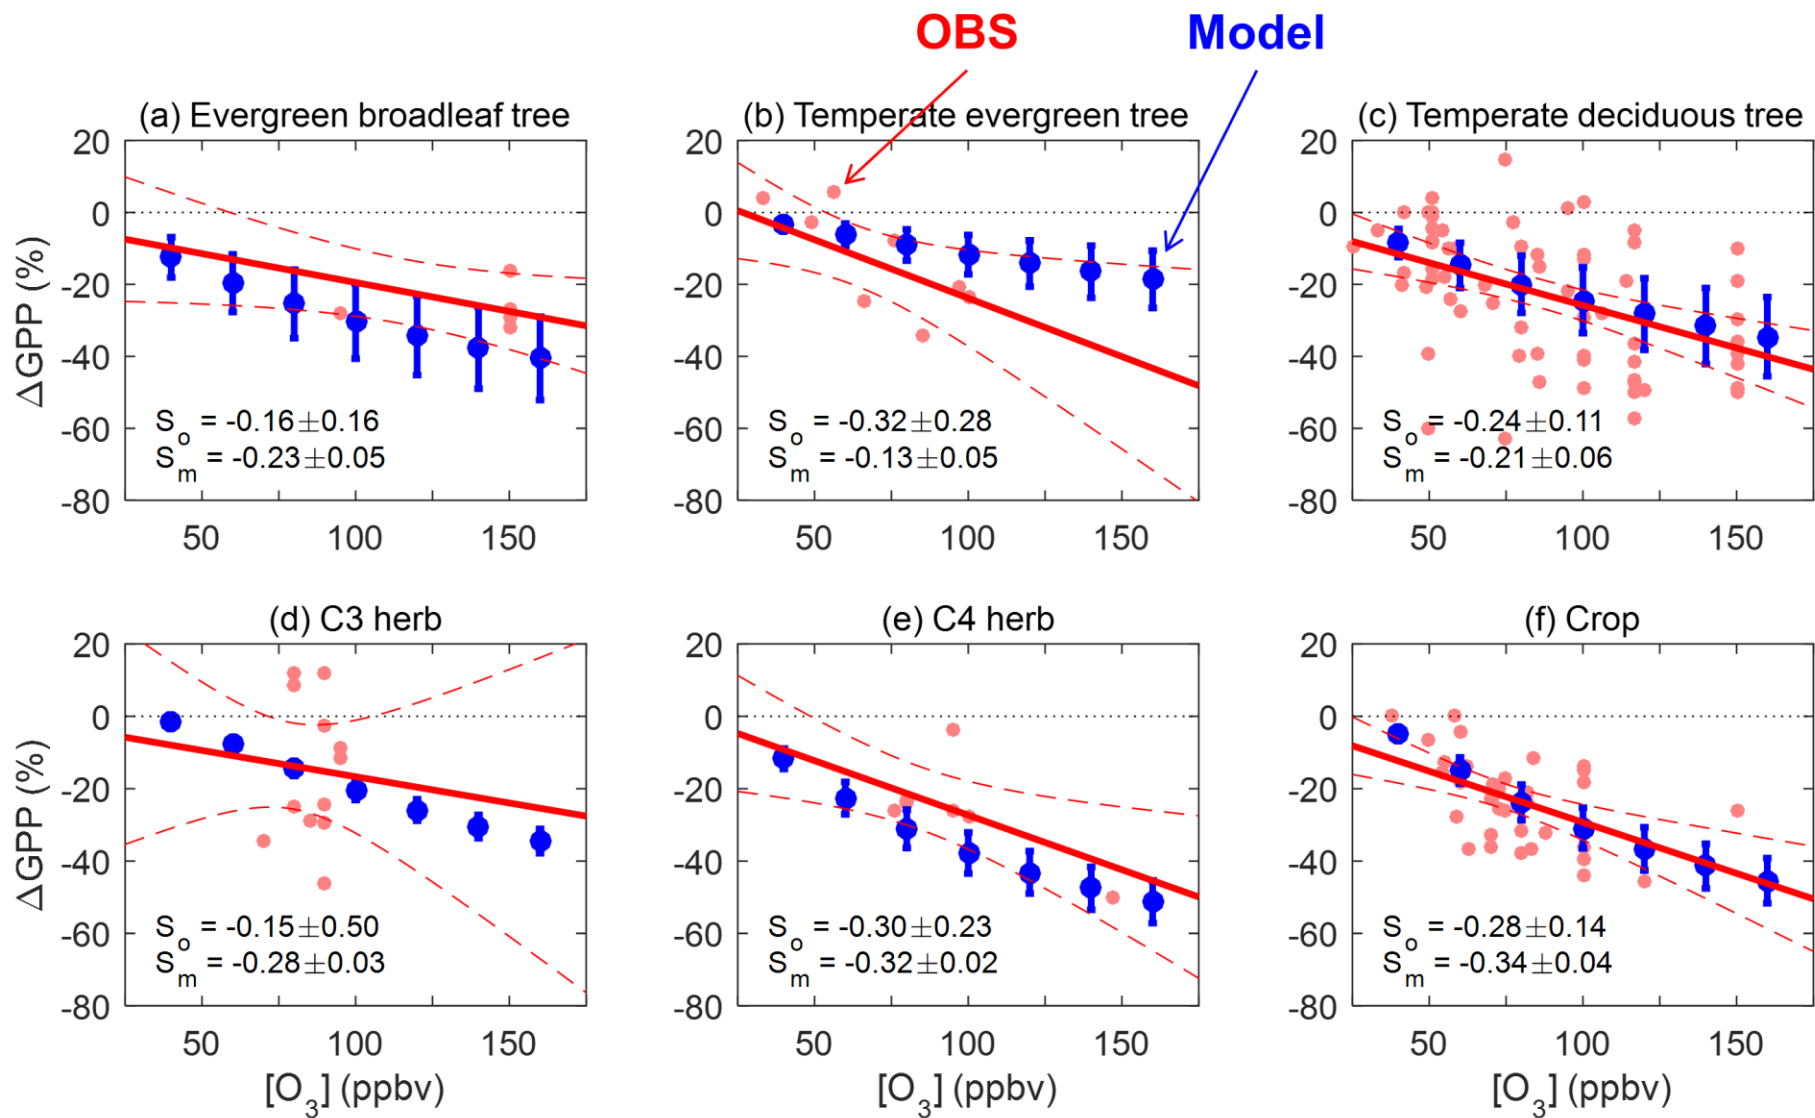

$$A' = F \cdot A_{net}$$

$$F = 1 - a \cdot U_{>O3T}$$

$$U_{>O3T} = \max[(F_{O3} - O3T), 0]$$

$$F_{O3} = \frac{[O_3]}{r_b + \kappa \cdot r_s'}$$

$$r_s' = \frac{1}{g_s'} = \frac{1}{F \cdot g_s}$$

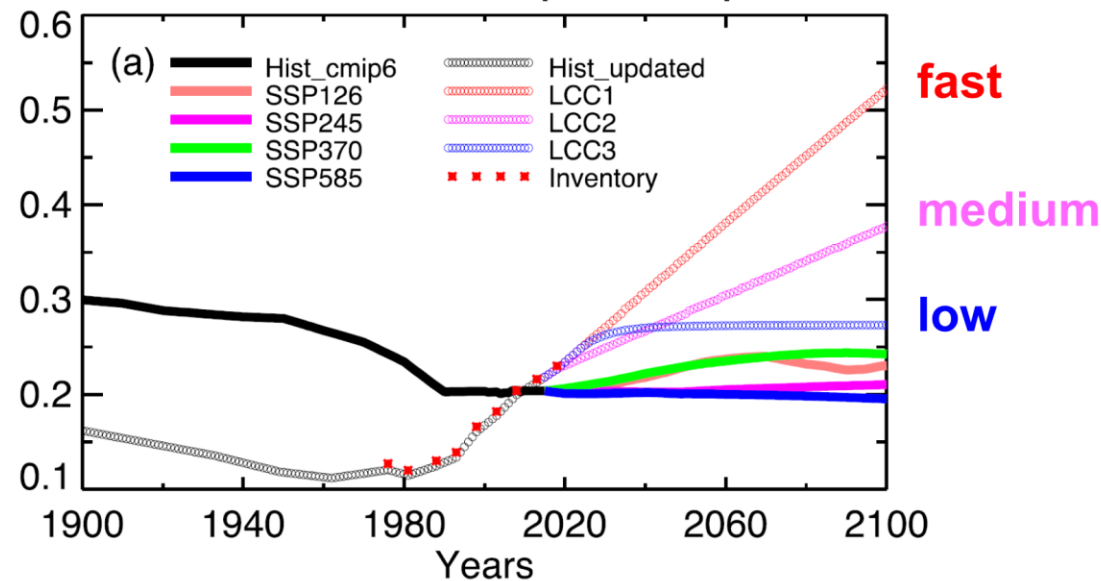

(Yue\* & Unger., NC 2018)

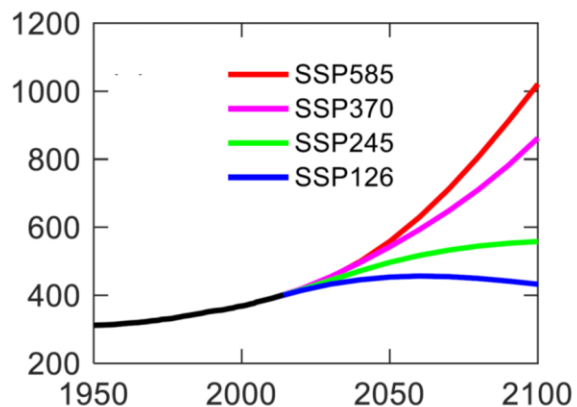

# Sensitivity experiments

- A total of 18 groups, isolating effects of CO<sub>2</sub>, O<sub>3</sub>, LCC, litter removal, and climate change
- Each group has 16×4 runs (Climate from 16 models under 4 SSP scenarios)
- Each run spans 250 years
- Hourly time step at 1°×1°

### Land cover (3 cases)

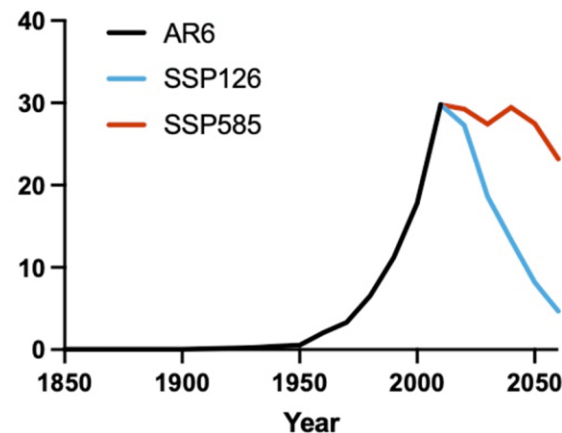

### CO<sub>2</sub> (4 SSPs)

### Climate (16 models)

### NO<sub>x</sub> emissions

### Litter removal

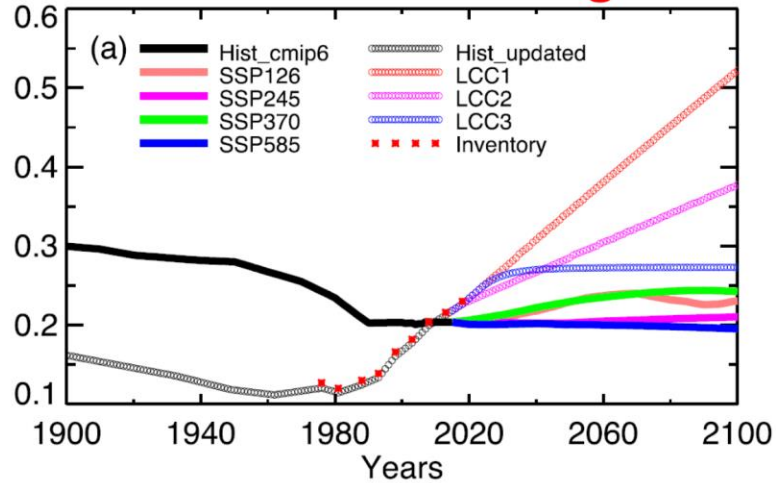

(Yue et al., *Sci. Bull.* in press)

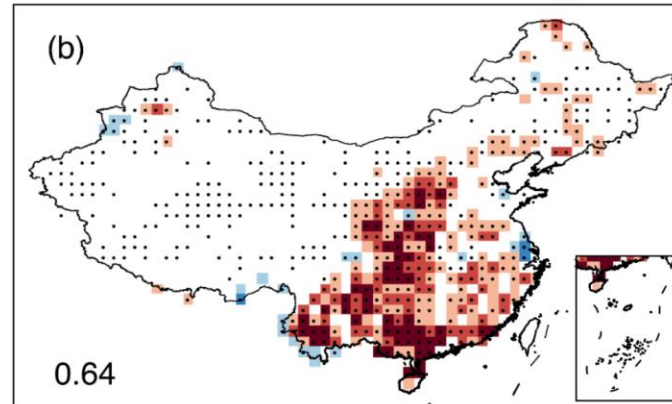

# Afforestation dominates the greenness in China

## Land cover change

## Observed LAI change

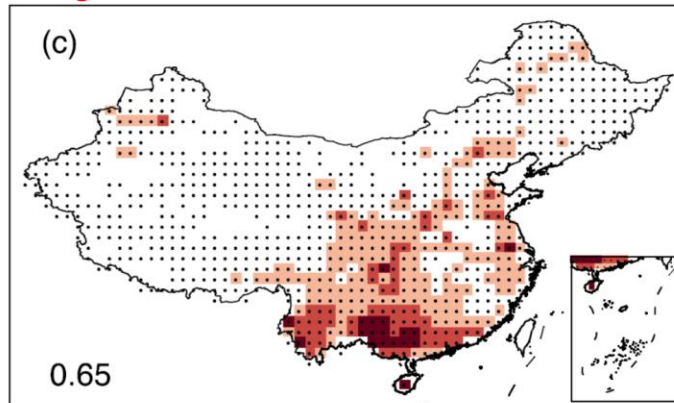

Trend of LAI ( $\text{m}^2 \text{m}^{-2}$  per century)

- Observations revealed increasing trend of LAI in the past 2 decades
- Simulations with adjusted LCC could reproduce observed LAI trend
- Simulations with CMIP6 LCC failed to capture the observed LAI trend

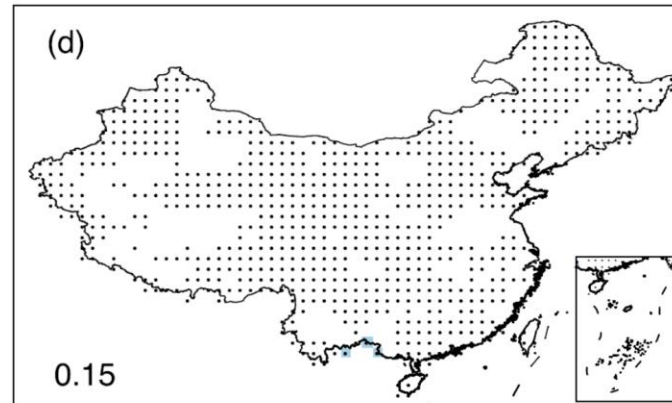

## Adjusted LCC simulations

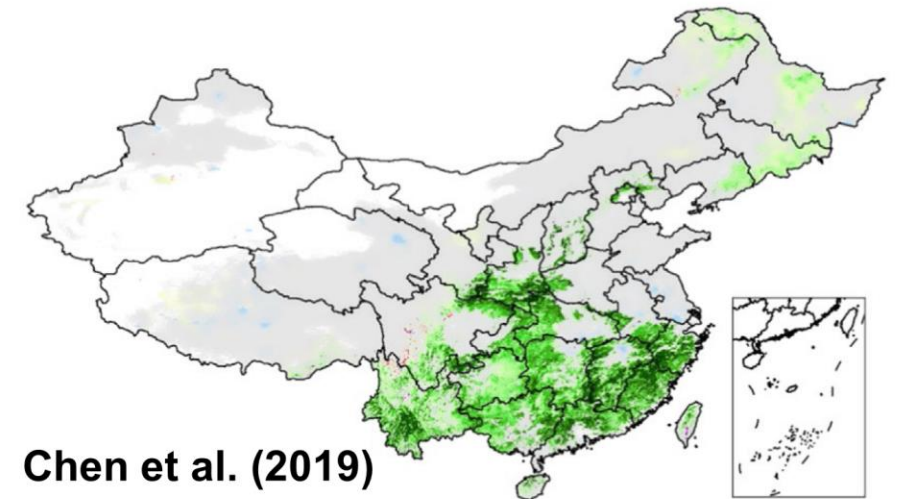

Trend of LAI ( $\text{m}^2 \text{m}^{-2}$  per century)

## CMIP6 LCC simulations

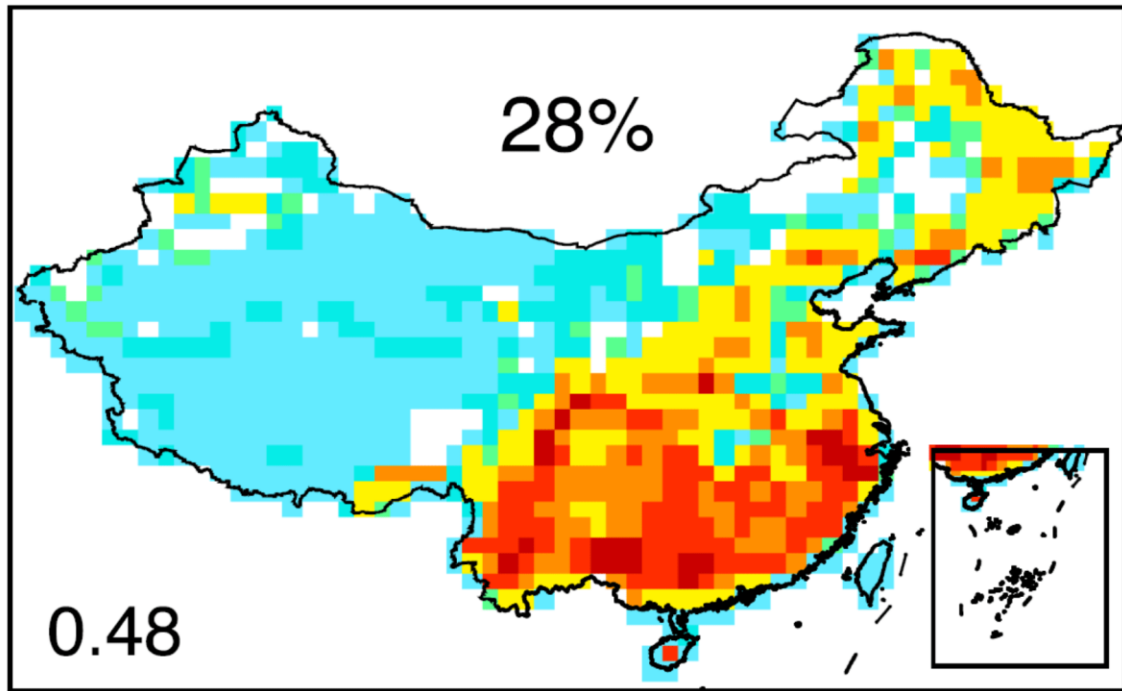

Trend of LAI ( $\text{m}^2 \text{m}^{-2}$  per century)

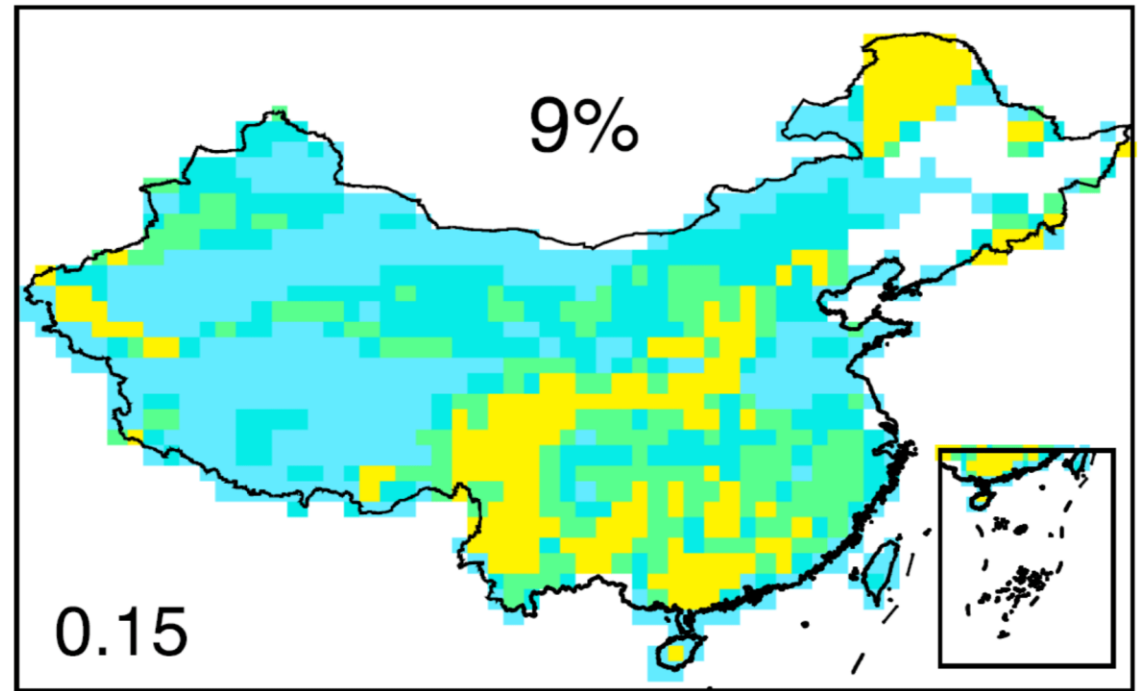

Trend in annual average LAI ( $10^{-2} \text{m}^2 \text{m}^{-2}$  per decade)

# Afforestation enhances present-day carbon sink in China

2010: Adjusted LCC

2010: CMIP6 LCC

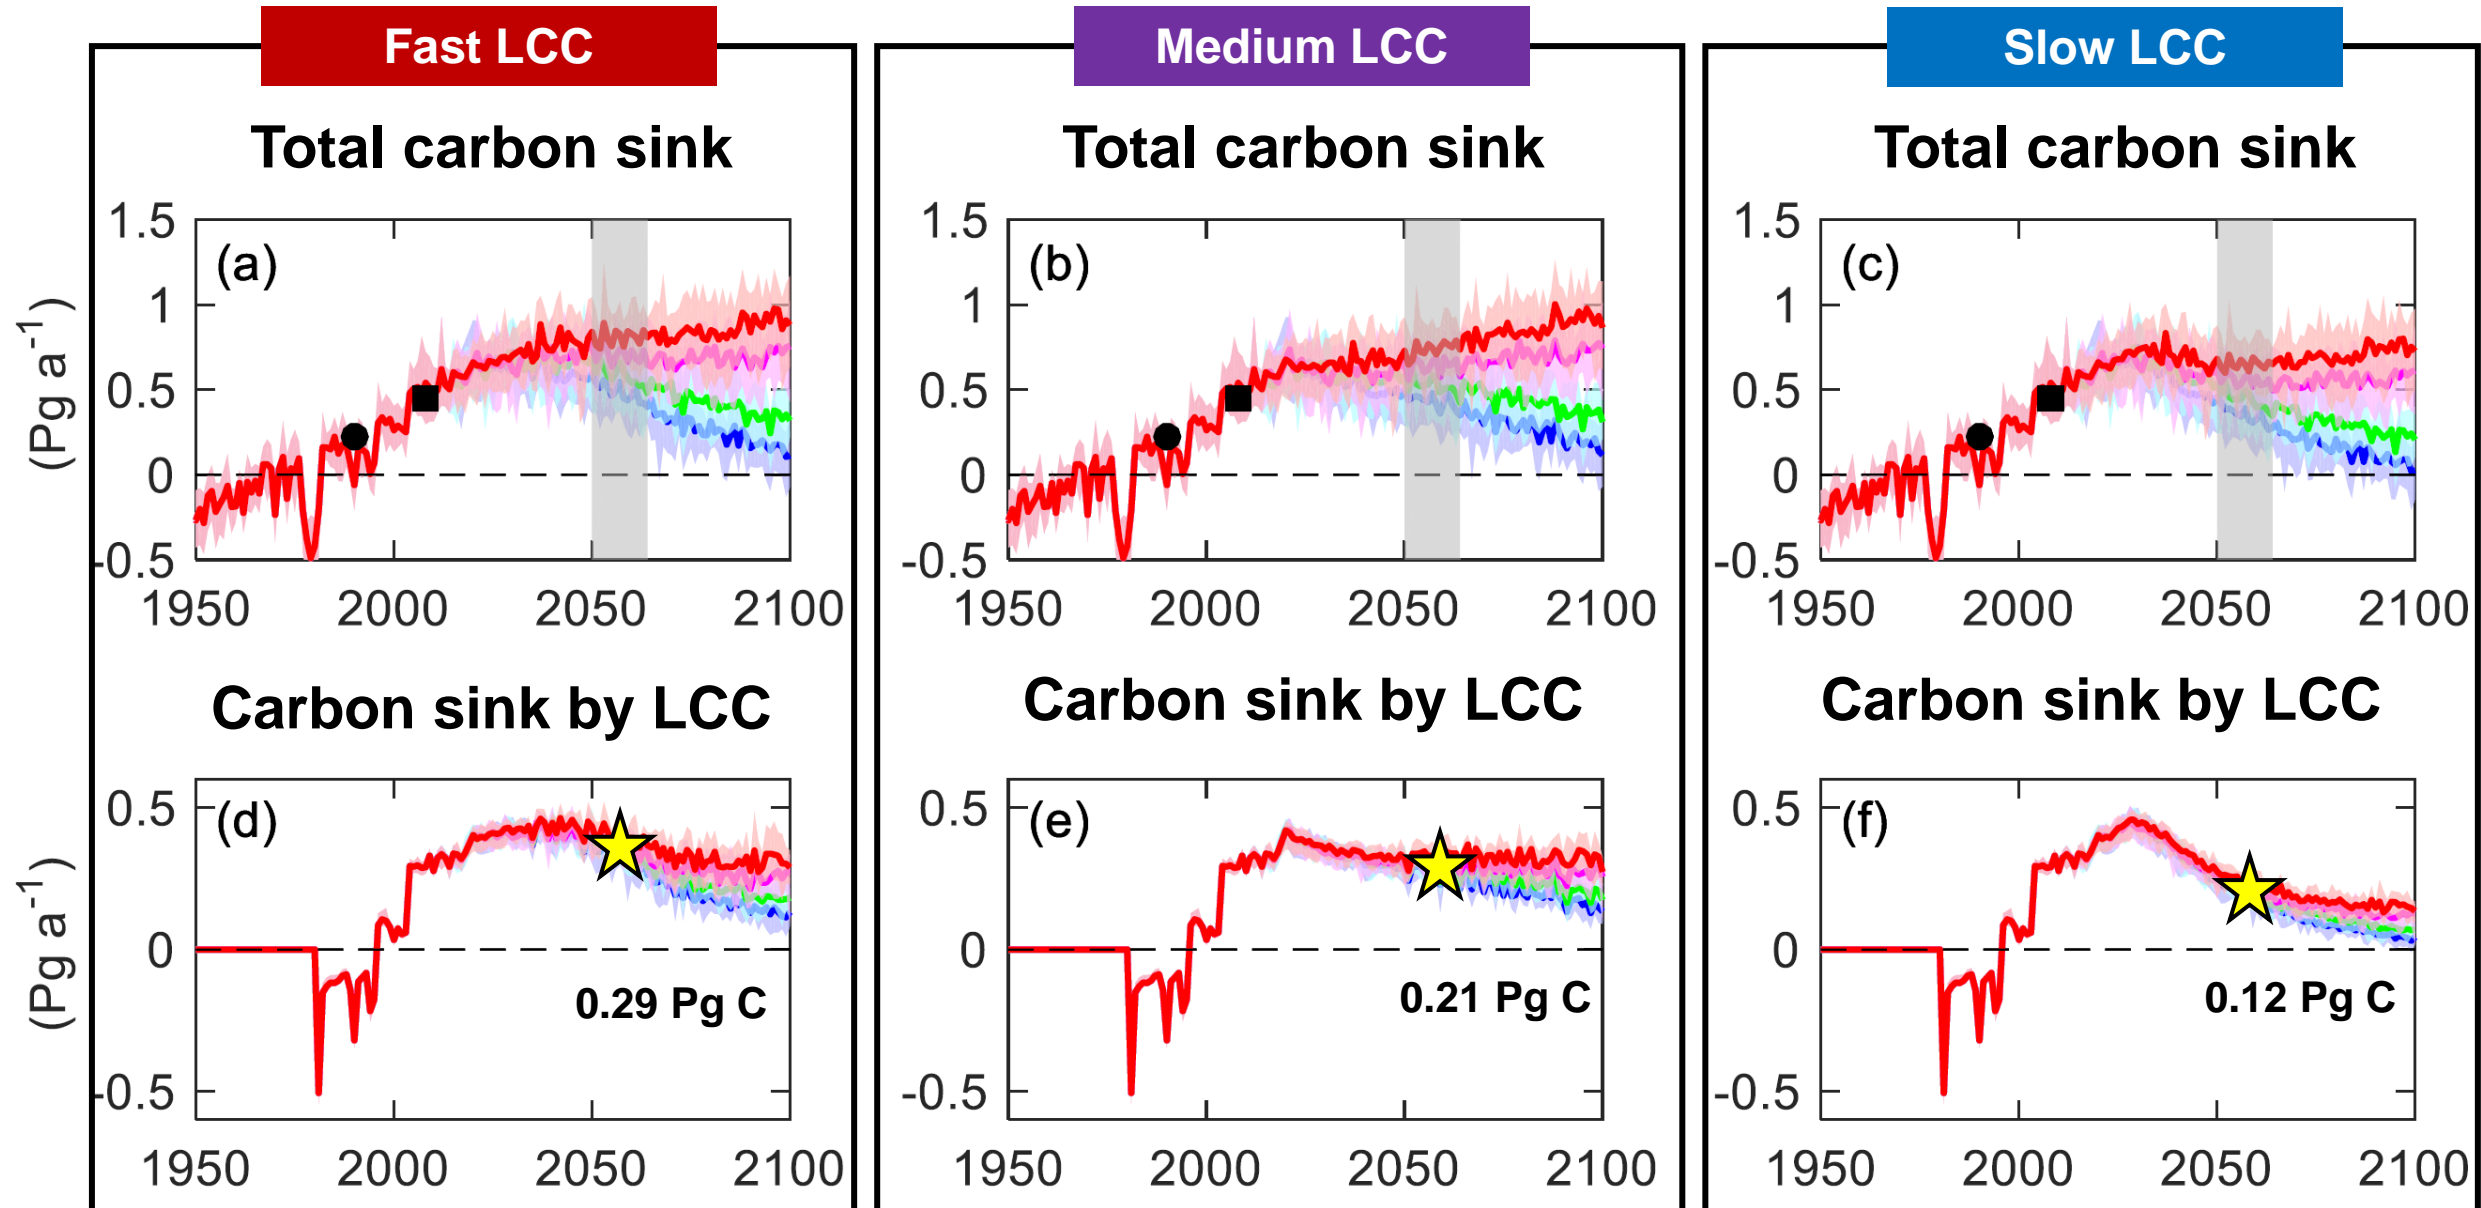

(g C m<sup>-2</sup> a<sup>-1</sup>)

(Yue et al., *Sci. Bull.* in press)

# Changes in carbon sink by afforestation

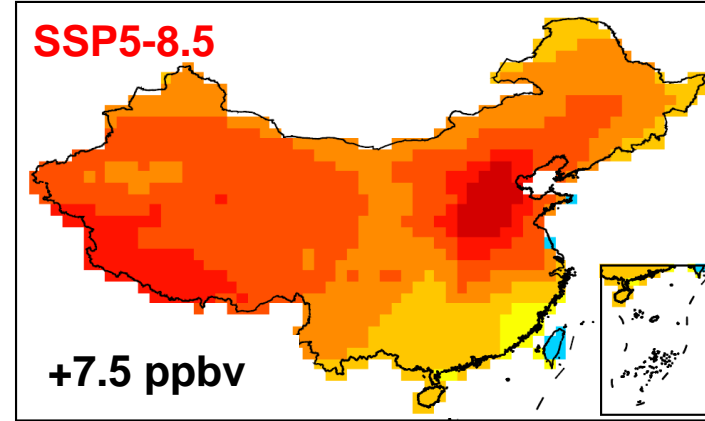

# Contributions to carbon sink by ozone control

Changes in ozone

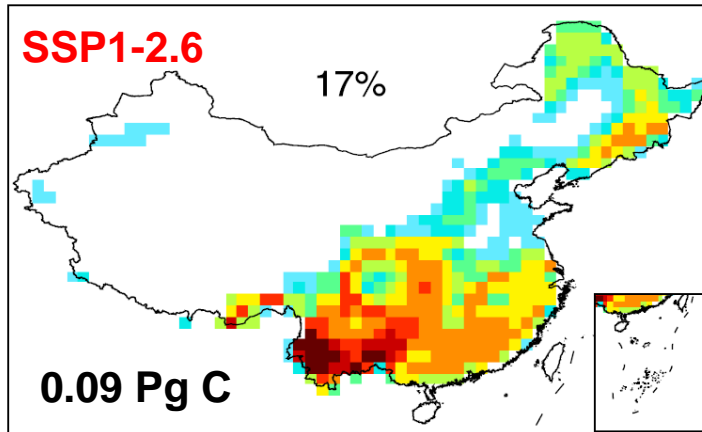

Changes in ozone

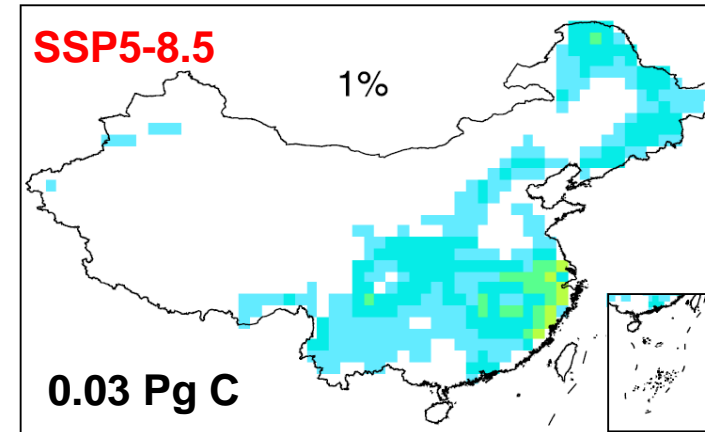

Changes in O<sub>3</sub> concentrations (ppbv)

Changes in C sink

Changes in C sink

(g C m<sup>-2</sup> a<sup>-1</sup> per 10 ppb)

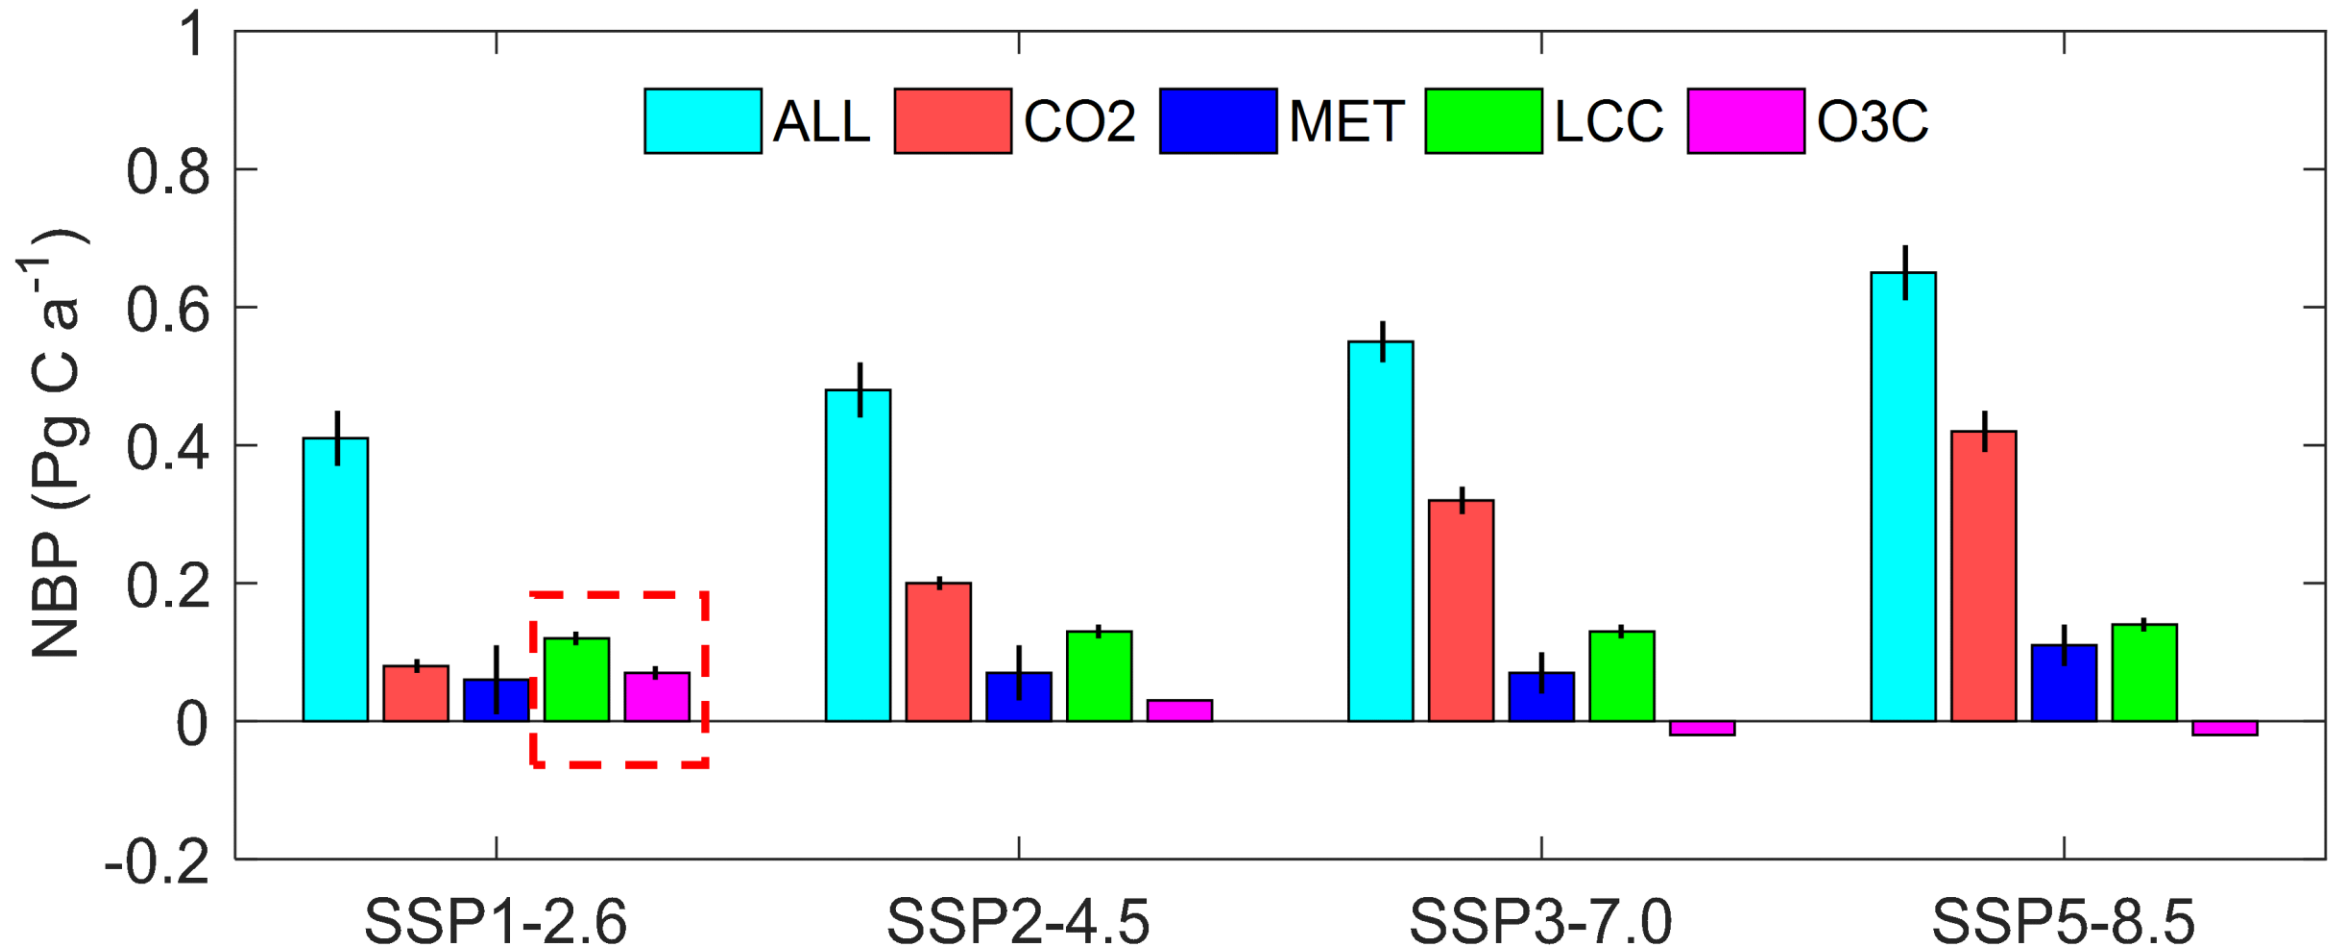

□ The larger benefit for carbon sink with deeper cut in ozone

Loss in C sink

# Comparisons of different drivers to carbon sink

□ The cost for 90% cut of NO<sub>x</sub> is \$65B, leading to a carbon gain of 2.06 PgC due to ozone reduction, equivalent of \$8.6 per ton CO<sub>2</sub>

□ The cost of afforestation is \$50-100 per ton CO<sub>2</sub>

(Yue et al., *Sci. Bull.* in press)

# Contributions to carbon sink by litter removal

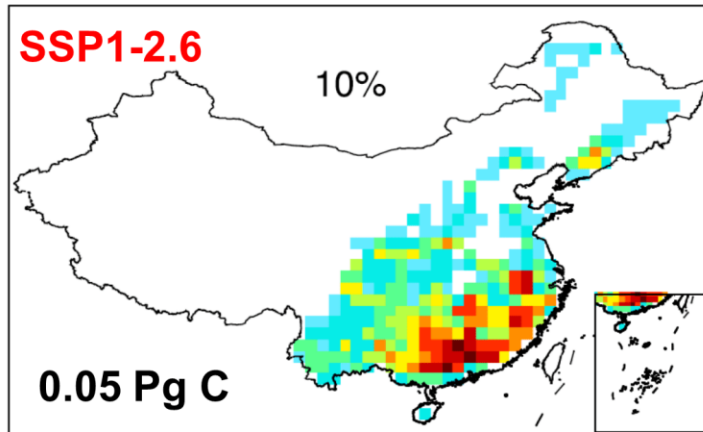

Changes in Rh

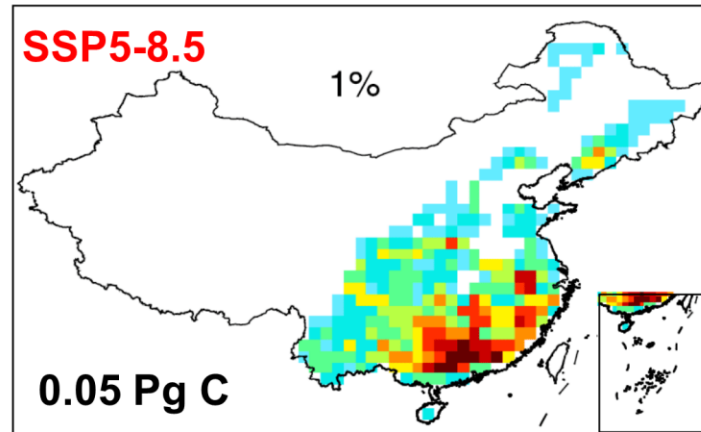

Changes in Rh

Changes in C sink

Changes in C sink

(g C m<sup>-2</sup> a<sup>-1</sup> per 5%)

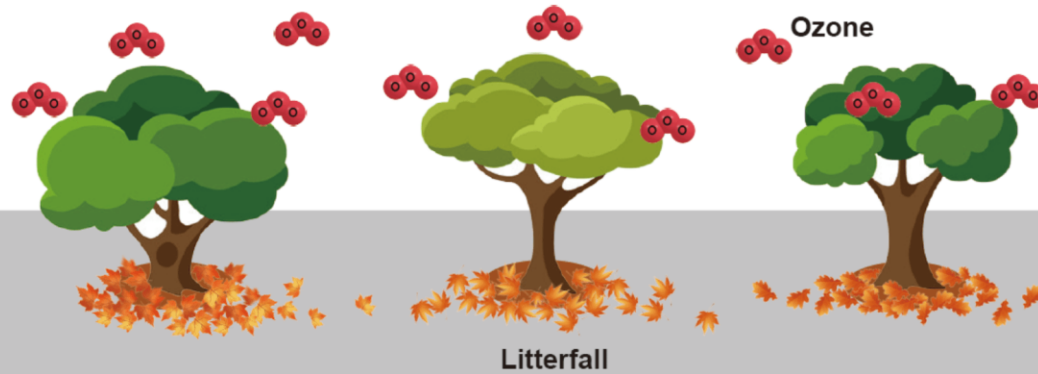

- ❑ Litter removal decreases soil respiration, and enhances carbon sink
- ❑ The effect of litter removal is **insensitive to climate scenarios and LCC**
- ❑ We suggest to remove only the litterfall on **planted forest**

# Conclusions

(a) Carbon sink in 2060 without interventions:  $0.23 \text{ Pg C a}^{-1}$

(b) Carbon sink in 2060 with interventions:  $0.47\text{-}0.57 \text{ Pg C a}^{-1}$

Forestation:  $+0.12 \text{ Pg C a}^{-1}$

Ozone control:  $+0.07 \text{ Pg C a}^{-1}$

For SSP1-2.6 scenario:

- By 2060, the carbon sink is only  $0.23 \text{ Pg C a}^{-1}$  if no interventions
- This sink enhances to  $0.47\text{-}0.57 \text{ Pg C a}^{-1}$  with proper human interventions, offsetting **90-110%** of the residue carbon emissions
- Reforestation:  **$0.12 \text{ Pg C a}^{-1}$**
- Ozone control:  **$0.07 \text{ Pg C a}^{-1}$**
- 20% litter removal:  **$0.06\text{-}0.16 \text{ Pg C a}^{-1}$**

(Yue et al., *Sci. Bull.* in press)
